

Mini lab task for DevSecops tools :

1. Explore knowledge about DevSecOps
2. Run versioning software using GIT :
 - Install git
 - configure your repo like using GitHub/bitbucket/etc
 - clone repo to local using git
 - from local create branch name “development” and “master”
 - create file dev.html in branch “development” and create file mas.html on branch “master”
 - run git staged and commit file
 - run git push to remote repo
 - check side remote repo GitHub/bitbucket makesure file present on each branch

3. Run Simple DevSecOps tools for scanning like :

- SAST tools : SonarQube
- SCA tools : SYNK
- DAST tools : Nikto

learn how the tools work including deployment the tools on local engine or cloud, then scan SAST and SCA the repository that contains the development source code file like [webgoat repo](#) or web url for nikto, then view the security findings of the scanning tools. Describe the findings for SAST, SCA, and DAST. For the SAST and SCA findings, **try to fix them** at the code or library level.

4. Build orchestator container Kubernetes :

- Deploy and install minikube k8 on local computer
- Create sample deployment app apache web server
- Test deployment like services on container apache can access by web on <http://xxxxxx>

5. **Make documentation** including the lab steps and configuration results according to the document output is a pdf / word document file of the lab results and prepare a presentation file to explain the understanding of all the processes that have been passed.
